# Mara*Jet* DI-V: The High-Grade Super Wide Solution

**Perfect Ink Profile for Large-Format Applications**

**Digital**
2012
29th Feb

**Highest print quality for Super Wide applications: Marajet DI-V excels through brilliant colour shades with wide colour gamut, high colour density, excellent fade resistance as well as exceedingly fast drying times.**

**Furthermore it offers best conditions for smooth changeovers: Due to the well adapted colour shades, no new profiling is necessary.**

## Applications

Marajet DI-V complements the Marabu range for the Super Wide Segment and has proven excellent results on Vutek® UltraVu® printers.

The DI-V substrate range includes different types of PVC self-adhesive foils (monomer, polymer, and cast foils) as well as PVC coated substrates like banner and tarpaulin materials, textiles, and suitable papers. Thanks to the high colour density even on certain uncoated textiles and flag materials brilliant prints can be achieved.

### Marajet DI-V – Your Benefits:

- **High-quality pigmentation**
  → Excellent light fastness (especially Yellow), best suited for long-term outdoor applications
- **Ideally adapted colour shades, no new profiling necessary**
  → Fast and simple change-over
- **Very fast drying times**
  → High production speed saves time and cost
- **High colour density and very wide colour gamut**
  → Brilliant reproductions, optimum print and picture quality
- **Very good scratch and chemical resistance**
  → For extreme indoor and outdoor stress

Owing to the high-quality pigmentation, a 2-year light fastness is achieved on corresponding high-grade foils. It can further be increased up to 3 years through an additional varnish overprint.

## Quality characteristics

Marajet DI-V gives excellent batch-to-batch quality within market-leading tolerances and shows very good stability against sedimentation which guarantees a shelf life of 24 months.
